Our understanding of the pathogenesis of hypertension and the development of new therapies for its management have each proven to be directly dependent on the availability and application of novel molecular biological methodologies. In Hypertension: Methods and Protocols, a panel of recognized experts from key institutions around the world describes in step-by-step detail many new and essential molecular techniques for cardiovascular hypertension research. The methods presented range widely from producing congenic, consomic, transgenic, and knockout models of hypertension to the gene transfer of specific genetic material using adenoviral and nonviral (polymers, liposomes, and antisense agents) vectors. Additional techniques described include single nucleotide polymorphism (SNP) genotyping, RNA interference, microarray analysis, pharmacogenetics, and pharmacogenomics for the genetic dissection of hypertension, as well as a practical method for deriving cardiomyocytes from embryonic stem cells that would serve as replacement cells for those damaged by hypertension or heart attack. A review of bioinformatic resources for pharmacogenomics describes the application of in silico strategies to identify nuclear matrix attachment regions. The protocols follow the successful Methods in Molecular Medicine series format, each offering step-by-step laboratory instructions, an introduction outlining the principle behind the technique, lists of the necessary equipment and reagents, and tips on troubleshooting and avoiding known pitfalls. State-of-the-art and highly practical, Hypertension: Methods and Protocols offers both novice and experienced hypertension researchers an indispensable collection of readily reproducible techniques for successful research, work that has already dramatically improved the outlook for hypertensive patients, and promises much future success.

CLIENT, CLARIFY, CREATE, CHANGE, CONFIRM, CONTINUE, CLOSE = THE SEVEN SECRETS OF

CONSULTANCY "Most change methods are effective. For the most part, each one is theoretically sound, well-researched, and clearly articulated. But when they're put in organizations, they fail-at least 70 to 80% of the time".

George Smart, Managing Partner, Strategic Development Incorporated The definition of a consultant is someone who facilitates organisational change and provides expertise on technical, functional and business topics during development or implementation. In other words a consultant is someone who helps others to change. However, change isn't such an easy target to achieve. Research shows that the vast majority of change programmes fail. On a daily basis we hear about projects that are delayed, cancelled, over budget or boycotted by the end user. The problem is that we can never force people to change - remember the backlash against Jamie Oliver's healthy school meals campaign where parents handed junk food to their children through school fences. The key to successful change is to engage with the end user and help them want to change. The Seven Cs of Consulting offers a consistent and collaborative language that helps both consultant and client deliver value through sustainable change. Based around the author's highly successful 7Cs model (Client, Clarify, Create, Change, Confirm, Continue, Close) this approach is simple and accessible but firmly grounded in research and real life experience. The 7Cs approach opens up the complexity of sustainable change to the consultant and client and helps them explore- and then avoid - the real issues that cause change to fail within a more professional and trusting relationship.

Minuturization and high throughput assay technology have brought the power of molecular evolution to the bioscience laboratory. Applied wisely, the evolutionary approach can quickly yield the desired result even where other methods have failed. From library generation by random or directed mutagenesis to screening and selection techniques -- the crucial steps for successful evolutionary biotechnology are described in detail in this practical guide that also includes valuable troubleshooting hints on frequently encountered problems. Modern methods for the surface display of peptides and proteins, selective enrichment of nucleic acid aptamers and high-throughput screening of industrial biocatalysts are explained, and computer-based methods for *in silico* protein and RNA engineering are described as an alternative to *in vitro* approaches. A special section covers the patenting regulations with regard to biotechnological innovations derived from directed evolution. As an added bonus, a CD-ROM is included that contains software tools for library design,

selection of mutagenesis positions, and various predictive algorithms. In short, this practice oriented handbook is an indispensable tool for every scientist working in this interdisciplinary research area.
